ATM 210  
Fall 2018

Please help Prof. Lang adapt the course material to better fit the class by answering the following questions honestly. Please add your name to the top of the questionnaire and return it to the TA by Wednesday, 29 August. Turning this in will count for 2 pts in your in-class assignments grade.

1. What do you hope to learn by taking ATM 210? (e.g., after reviewing the syllabus, what are the things you hope will stick with you 2+ years after taking this course?)

2. How would you describe your learning style (i.e., what do you find is your best way to learn)?

3. What is your background in atmospheric or climate science?
4. What do you hope to do after you graduate? Be as specific as you want, I will use this info in how I structure the material at the end of the semester (e.g., if all of you want to be weather forecasters, we’ll spend more time on that, or perhaps all of you want to know about the implications of weather/climate on health).

5. Is there anything else about your learning style/academic background/academic interests/extracurricular activities that you would like your ATM 210 Professor to know before the semester begins?

Thanks for taking the time to provide this info. It will help in developing material for this semester.
