

1 **2D Squall Line demonstration (Part 2)**

2 *ATM 419/563 Spring 2023 - Fovell*

3 -----  
4 **\* Exploring microphysics options**

- 5 -----  
6 • Move into your SQUALL directory.  
7 • Edit your namelist.input to set **mp\_physics** to **your assigned option (see PPT)**  
8 • **You may also need to change the value for hail\_opt**

9  
10 mp\_physics = ##

11  
12 \$ srun -p snow ideal.exe

13  
14 \$ srun -p snow wrf.exe

- 15  
16 • Unpack your simulation, using w2g and **control\_file.ensemble [NOTE THIS!!!]**  
17 • Name your file mp## where ## is your microphysics option.  
18 • **If your option is < 10, use leading zero (e.g., mp02, or mp07)**  
19 • **If you are using mp=6 or 16 with hail, call the runs mp66 and mp77, respectively**

20  
21 \$ w2g control\_file.ensemble mp##

- 22  
23 • Copy your mp##.ctl and mp##.dat files to \$LAB/SQUALL/  
24

25 -----  
26 **\* GrADS ensemble dimension (after all runs are completed/processed)**

- 27 -----  
28 • GrADS has an ensemble dimension that can streamline looking at a set of related  
29 • experiments. The problem is the files have to have **identical ctl files.**  
30 • In our case, different microphysics schemes output different hydrometeor arrays  
31 • (as many as 17 [!]: mixing ratios for cloud, ice, rain, snow, graupel and hail, and  
32 • number concentration variables for some or all of those species)

33  
34 • *Our ensemble will only consider schemes that produce QCLOUD and QRAIN at a  
35 minimum. Some schemes also produce QICE, QSNOW, QGRAUPEL, or QHAIL but we  
36 won't archive that even if they are computed*

- 37  
38 • So **control\_file.ensemble** ONLY outputs those microphysics-related hydrometeor  
39 fields even if the scheme produces others

40  
41  
42  
43  
44

```

45 • Move into my SQUALL directory, where the microphysics ensemble members are
46 $ cd $LAB/SQUALL
47
48 • Launch GrADS and open mp_ensemble.ctl
49
50 • Using uthetap.gs, wthetap.gs: visualize final time U or W and perturbation theta fields
51 for some members. Feel free to explore more later!
52
53 set e 1      # 1st ensemble member: Purdue Lin (mp=2) examined in Part 1
54 uthetap.gs
55 set e 14     # NSSL's version of Purdue Lin (mp=21)
56 uthetap.gs  # note difference
57 set e 17     # Thompson with aerosol (mp=28)
58 uthetap.gs  # note difference
59 set e 2      # Kessler scheme (no ice species, mp=1)
60 uthetap.gs  # note difference
61
62 set e 4      # WSM6 [qc,qi,qr,qs,qg, single moment, mp=6]
63 wthetap.gs  # W and perturbation potential temperature
64 set e 10     # WDM6 [qc,qi,qr,qs,qg, double moment, mp=16]
65 wthetap.gs  # this version is producing pre-squall convection
66 set e 16     # WDM7 [qc,qi,qr,qs,qg, plus hail, double moment, mp=26]
67 wthetap.gs  # pre-squall convection absent again
68
69 set e 1      # back to Purdue Lin (essentially the oldest ice microphysics scheme)
70 uthetap.gs
71 set e 22     # the incredibly expensive bin microphysics scheme (mp=32)
72 uthetap.gs  # did all of that extra computational work really matter?
73 set e 21     # the somewhat less expensive version of the bin scheme (mp=30)
74 uthetap.gs  # what the heck?
75
76 • A Hovmoller diagram for near-surface temperature, except the vertical axis is the
77 • ensemble dimension. Identify leading edge of cold pool and how it varies among
78 • members. On vertical axis, numbers = order, numbers ≠ mp scheme
79
80 reset
81 set t last   # sets last available time
82 set z 1
83 set e 1 last # sets range to all ensemble members
84 set x 1 201
85 set xaxis 0 400 50
86 d tc       # near-surface temperature (deg. C)
87 draw ylab member number not scheme number
88 draw xlab x (km)

```

89 • A Hovmoller diagram for ensemble precipitation. This plots **rainnc**, or total  
90 precipitation received at the surface accumulated to the time selected, in millimeters.  
91 (Despite the name, rainnc also includes precipitation in the form of snow, graupel, or  
92 hail, if any. Also, it *only* includes precipitation from the microphysics scheme, not the  
93 cumulus scheme, which is not being used here anyway.)  
94  
95 reset  
96 set t last  
97 set z 1  
98 set e 1 last  
99 set x 1 201  
100 set xaxis 0 400 50  
101 set black 0 0  
102  
103 d rainnc # total precip (including frozen), in mm  
104 draw ylab member number not scheme number  
105 draw xlab x (km)  
106  
107 • Max precip accumulations for each ensemble member. Note substantial variation.  
108 (100% difference from weakest to strongest precip producers. Note also bin schemes  
109 tend to produce a lot less precip than most bulk schemes. Are bulk schemes overdoing  
110 it?)  
111  
112 c  
113 set z 1  
114 set x 1  
115 set t last  
116 set e 1 last  
117 set vrange 0 300  
118 d max(rainnc,x=1,x=201)  
119 draw xlab ensemble member  
120  
121 • A hazard of squall lines is straight-line winds associated with descended rear inflow  
122 currents. This plots maximum near-surface U for each ensemble member at final time. I  
123 might want to look at the max over a set of times, owing to small-scale temporal  
124 variability, but which schemes are indicating the largest and smallest wind hazards?  
125  
126 c  
127 set z 1  
128 set x 1  
129 set e 1 last  
130 set vrange 0 16  
131 d max(u,x=1,x=201)  
132

133 • evolution of total domain precip RAINNC over time, for 22 ensemble members. Which  
134 schemes produce the most and the least rain?  
135  
136 reset  
137 set x 1  
138 set z 1  
139 set t 1 last  
140 • ESTEP from e=1 to e=22, vrange 0-3000 == total precip range of 100%!  
141 estep.gs tloop(sum(rainnc,x=1,x=201)) 1 22 0 3000  
142  
143 **explore more! (end of Part 2)**  
144
