

1 **March 2022 Thunderstorm demonstration**

2 *ATM 419/563 Spring 2024 - Fovell*

3 -----

4 • **SETUP**

- 5 • Create a directory called `TSTORM` and move into it
- 6 • Copy `$LAB/SCRIPTS/WRF_REAL_SETUP_SNOW.TAR` into it and unpack as per usual
- 7 • Copy `$LAB/TSTORM/plot_WRF_TSTORM.ipynb` to your TSTORM directory
- 8 • Execute `make_all_links_SNOW.sh`

9

10 • **GEOGRID**

- 11 • Edit `namelist.wps` to configure our domain
 - 12 - `max_dom = 2` *[so for multicolumn entries, the 2nd column matters]*
 - 13 - D1: `e_we = 115, e_sn = 100`
 - 14 - D2: `e_we = 166, e_sn = 100`
 - 15 - `dx = dy = 12000`
 - 16 - Lambert, `ref_lat = 42.6, ref_lon = -76`, both `truelats = 42.6, stand_lon = -76`
 - 17 - **MAKE SURE you do not write these numbers with more than one decimal point**

- 18 • Position D2 within D1

19 `i_parent_start = 1, 22,`

20 `j_parent_start = 1, 32,`

- 21 • Visualize domain using `'ncl plotgrids.ncl'` and/or `plot_WRF_domain.ipynb` and
- 22 compare to image in PPT [**don't skip this step!**]
- 23 • Run `geogrid: srun -p snow -n 8 geogrid.exe`
- 24 • Visualize terrain with `plot_WRF_terrain.ipynb`

25

26 • **UNGRIB**

- 27 • `Vtable.GFS` as `Vtable`
- 28 • Edit `namelist.wps` for our start and end times, and `interval_seconds`
29 `start_date = '2022-03-31_12:00:00', '2022-03-31_12:00:00'`
30 `end_date = '2022-04-01_00:00:00', '2022-04-01_00:00:00'`
31 `interval_seconds = 3600,`

32

- 33 • Link to the GFS data:

34 • `link_grib.csh $LAB/DATA/GFS_2022033112/gfs*` .

- 35 • Submit `ungrib` script. You may have to wait for resources. `Ungrib` takes time:

36 `sbatch -p snow submit_ungrib`

- 37 • Looking for at end of `ungrib.log`:

38 `**** Successful completion of program ungrib.exe ****`

39

- 40 • **METGRID** **[after both `ungrib` and `geogrid` are complete]**

- 41 • No further editing of `namelist.wps` should be needed at this point

- 42 • Submit `metgrid` script

43 `sbatch -p snow submit_metgrid`

- 44 • `tail -f metgrid.log.0000: **** Successful completion of program metgrid.exe **`

- 45 • What are num_metgrid_levels, num_st_layers, num_sm_layers????
 46 → select one of the met_em outputs, dump header, pipe to more
 47 → edit num_metgrid_levels, num_metgrid_soil_levels in namelist.input
 48
- 49 • **REAL**
- 50 • Edit namelist.input to configure time information
 51 • We will run for 12 hours, so: run_days = 0, run_hours = 12
 52 • Set same start and end times as namelist.wps
 53 • Same interval_seconds as in namelist.wps
 54
- 55 • Edit namelist.input for domain information
 56 • time_step = 30 [this is specified for D1 ONLY. See PPT.]
 57 • **max_dom = 1** [we are running the single domain version at this point]
 58 • Same e_sn, e_we for D1 and D2 as in namelist.wps
 59 • Leave e_vert at 57 for each domain [they need to be set equal]
 60 • dx = 12000, 4000, and dy = 12000, 4000
 61 • Nest positioning to match namelist.wps
 62 i_parent_start = 1, 22,
 63 j_parent_start = 1, 32,
 64 • Make sure num_metgrid_levels, num_metgrid_soil_levels are correct
 65
- 66 • **Edit namelist.input for physics information!! Some of these need to be changed**
 67 • Thompson microphysics mp_physics = 8 for both domains
 68 • Noah land surface model sf_surface_physics = 2 for both domains
 69 • MYNN surface layer sf_sfclay_physics = 5 for both domains
 70 • MYNN PBL bl_pbl_physics = 5 for both domains
 71 • Cumulus cu_physics = 1, 0 [Kain-Fritsch scheme, **ON** for 12 km, **OFF** for 4 km domain]
 72
- 73 • Submit real script: sbatch -p snow submit_real
 74 • tail -f rsl.out.0000: "real_em: SUCCESS COMPLETE REAL_EM INIT"
 75
- 76 • **WRF for control run**
 77 • Submit wrf script: sbatch -p snow submit_wrf
 78 • tail -f rsl.out.0000: "wrf_em: SUCCESS COMPLETE WRF"
 79
- 80 • **Visualization of control run**
 81 • Launch ARCC Jupyterlab. Either Batch or Snow is OK; minimal resources will suffice.
 82 • Launch and execute plot_WRF_TSTORM.ipynb
 83
- 84 • **Cumulus ensemble**
 85 • See slides 37+
 86
